Web Technologies Assessment

This website was implemented as a static HTML, CSS and JavaScript application so it can be opened directly in a browser without Live Server.

I have used six pages, all of which are linked. These include: Home, About Us, Boxes, Events/News, Contact Us and Register. This covers the required core pages while separating the form confirmation page from the form itself.

The layout follows the learning material given; a semantic header, nav, main content area, aside and footer are used across the pages, and all have the same consistent styling, thanks to the central CSS file. The page width is fluid at 95% with a maximum width of 1200px, as requested.

The navigation is a two-tier horizontal menu on desktop and changes to a small mobile menu below 700px, which has been chosen so that a consistent user journey can be experienced on both a mobile and computer. At 950px the font size is reduced to 85%, matching the brief. The visual design uses the supplied FoodBox images and a green, orange and neutral colour palette to reflect produce, farming and delivery, with CSS being chosen to create various classes which have been used consistently across the pages.

I avoided decorative effects for the time being, and opted for a clean, simple design, that fulfils all requirements. Tables use caption, thead, tbody, tfoot and scoped headings, which have been chosen for enhanced accessibility.

The registration form has been designed to collect names, UK addresses, an email, UK mobile number, membership plan, preferred delivery day, update preferences and comments. JavaScript validates required fields, email format, UK mobile format, selected plan, delivery day, update choices and contact permission before allowing submission. This has been chosen so that correct data can be inputted. If valid, the data is displayed on register.html (the "Register" page) using query string values. An edge case is handled when register.html is opened without submitted data, where a clear no-data message is shown.
